

The Nunavut and Northwest Territories Raptor Database: User's Manual

Brief description:

The present report details the way Nunavut and Northwest Territories raptor nesting data are stored in a single database, summarizing up to 4,000 nesting locations gathered over 20 years. The Raptor Database has become a powerful resource for researchers and wildlife managers interested in aspects of northern-nesting raptors. This report describes the data collection and storage protocols for the Raptor Database so that the data can be effectively supplemented and interpreted in the future. The main aim is to encourage reporting of raptor information from anyone living and working in the North as to secure high quality data to support effective wildlife management
